

DON'T FORGET TO CLEAN UP YOUR TEMPDB REGULARLY (NOT IN PRODUCTION ENVIRONMENT)

Cleaning up your **TempDB** is pretty simple: just restart your MS SQL Server Service. And...to make it just a little bit easier (if possible)...you might want to schedule it . :-)

- Start with creating a Batch-file (for example: '**Restart SQL Services.bat**')
- Start **Notepad** and copy/paste the following text:

```
@ECHO OFF
NET STOP SQLSERVERAGENT
NET STOP MSSQLSERVER
NET START MSSQLSERVER
NET START SQLSERVERAGENT
```

- Save the file and rename it to '**Restart SQL Services.bat**'.
- Now go to **Start Menu -> Control Panel -> Scheduled Tasks -> Add Scheduled Task**.
- Click through the wizard and select '**Command Prompt**', setup the schedule and fill in the right credentials.
- Before you hit Finish, don't forget to select: '**Open advanced properties for this task when I click Finish**'.

Within the *Advanced Properties Window* @ '**Run**':

Select the Batch-file you've created and that's it!
